

Are YOU ready to learn & play?!

Calling all preschool children to participate in a new study at Case Western Reserve University!

WHO: children ages **3-5 years old** who are either **typically developing** or have an **autism spectrum disorder (ASD)**

WHAT: the neurodevelopment research lab at CWRU is conducting a study to better understand **play, social ability, and parent-child interactions** in relation to **hormones expressed during social engagement** and **telehealth parent-training intervention**

For typically developing children: a one-time study visit where your child will undergo measures of play and social ability and their saliva will be collected to measure hormone levels.

For children with ASD: a baseline study visit where your child will undergo measures of play and social ability and their saliva will be collected to measure hormone levels. Then, parent and child will undergo an **8-week remote intervention program** targeting play, emotion regulation, parent and peer engagement and social ability. Participants will return for a post-intervention visit similar to the baseline visit.

WHERE: Baseline and post-intervention visits can occur at: (1) **your home** or (2) **our research lab** on CWRU's campus

If you are interested in participating, please contact our research team at **neurodevelopmentresearchlab@gmail.com** or **(216) 368—0112** to schedule a research visit or to receive more information!
